INDUSTRY NEWS

Rear drum brake upgrade kits

Master Power Brakes expands product line to include rear drum brake upgrade kits for small bearing Fords®, Mustangs® and Cougars®

MOORESVILLE, NORTH CAROLINA – SEPTEMBER 22, 2006 – Master Power Brakes now sells rear drum brake upgrade kits (SKU: DR1500K) for 1957 – 1976 Ford® cars, and 1964 – 1973 Mustang® and Cougar® cars with 8" and 9" small bearing rear ends.

Master Power Brakes already sells disc brake kits as well as rear drum brake upgrade kits for Ford with large bearing rear ends. The company extended its product line so that customers with small bearing Fords can also benefit from the high quality, cost-effective brake upgrade solution.

"The key features of this product are the 11" drums and high performance brake shoes," said Pat Szyslowski, sales representative. "The benefit of having 11" drums over the original 9" is that increasing your friction surface area will directly result in shorter stopping distance and less brake fade. In addition to that, the high performance brake shoes provide an increased friction co-efficient, low noise, low dust, longer shoe life and safe stopping."

The kit is specifically designed for 8" and 9" small bearing rear ends with 3-3/8" x 2" flange bolt patterns although it can be modified easily to fit 1/2" bolts.

"Our company prides itself on having easy-to-install kits and the new rear drum kits are no exception. All of the components are pre-assembled on new backing plates. Customers can just remove the old drum components and install our kit," said Scott Mahoney, president.

To learn more about the small bearing rear drum brake upgrade kit, visit www.mpbrakes.com/products/product_detail.cfm?product_id=695. For more information on Master Power Brakes and its products, visit www.mpbrakes.com or call 888-351-8781.
