

WARNING

Proper operation of your brakes is essential for your safety and the safety of others. Any brake service should be performed ONLY by persons experienced in the installation and proper operation of brake systems. It is the responsibility of the person installing any brake component or kit to determine the suitability of the component or kit for the particular application. After installation and before operating your vehicle, be sure to test the function of the brakes under controlled conditions.

DO NOT DRIVE WITH UNTESTED BRAKES!

INSTALLATION INSTRUCTIONS

DB1721 SERIES

INCLUDED COMPONENTS

Your disc brake conversion kit will contain the following components:

1. Caliper mounting brackets and hardware
2. Calipers with pads
3. Rotors
4. Bearings, seals and dust caps
5. Caliper hoses

INSTALLATION

Installation of the disc brake kit will require the use of the following tools:

3/8" ratchet drive set
Box end wrench set
Pliers
Line flaring tool

Mallet
Ball joint fork
Screwdriver
Line bending tool

Flare wrench set
Drum brake tool
Snips

Always refer to the vehicle owners manual for the correct torque specifications when installing this kit

1. Remove the stock Chevy front drums, brakes and backing plates. Clean and inspect the spindles for cracks or damage. Be sure to thoroughly clean out the 5/8" threaded hole at the top of the spindle. This is extremely important. Use a non oil based cleaner such as Brake Clean. Clean the threads out with a bottoming tap if necessary.
2. 1959 and 1960 only
In order to install the inner bearing on some spindles, you must remove .0004" from the inner bearing seating diameter. This can be accomplished with 240 grit emery paper and a rotary sanding motion on the spindle. This operation must be continued until the inner bearing can be slid onto the spindle without binding. Do not try grinding or filing the spindle. It only takes a few minutes with emery paper.
3. Take the small support bracket and install it on the outer surface of the spindle in the two lower holes. Install one of the long 2-3/4 x 7/16" bolts through the support bracket, through the rear hole on the spindle and through the stock steering arm. Install the shorter 7/16 bolt in the same manner through the front hole. Install locknuts and tighten.

4. Install the larger caliper bracket as above. Install the 1/2 x 2 1/4" bolt through the caliper bracket, spacer and support bracket as shown. Install the 1/2" locknut but do not tighten, just snug it up.

5. Install the 5/8 x 1 1/4" large bolt and lockwasher through the top of the bracket into the spindle. Now tighten all bolts and nuts.

GREASE ALL WHEEL BEARINGS WITH AUTOMOTIVE BEARING GREASE BEFORE INSTALLING

6. Take the rotor and clean it. Install the inner A6 bearing followed by the 7934S seal. Be sure to seat the seal into the rotor.

7. Install the rotor onto the spindle followed by the outer A2 bearing. Install the bearing retaining washer and the supplied wheel bearing nut. Be sure to install the cotter pin.
8. Turn the rotor on the spindle and check for any interference or minimal clearance between the inside surface of the rotor and the outer mounting bracket. Trim the bracket if necessary. Check for adequate clearance on the 1/2" bolts also. Be sure to install the cotter pin onto the spindle nut to secure.
9. Install the loaded caliper onto the spindle using the supplied caliper mounting bolts. **THE CALIPER BLEEDER SCREW MUST FACE UP!**
10. Repeat the procedure for the opposite side.
11. Connect the caliper hoses to the calipers making sure that the brass mounting block of the caliper hose is sandwiched between the two copper crush washers. The order should be caliper, copper washer, brass mounting block, copper washer, hose bolt.
